

ClearCabin - Antimicrobial Barrier Treatment

Aircraft operators large and small are challenged with reducing health risks for the passengers and employees especially with controlling the spread of bacteria and viruses that can make people sick. The interior of an aircraft can be home to bacteria, viruses, mold, fungi and despite rigorous and regular cleaning, harmful bacteria can linger.

ClearCabin - powered by PreventX is an antimicrobial barrier treatment that when applied to a surface forms an invisible bio-barrier coating that wages non-toxic warfare against nasty microbes and will arrest the growth of bacteria and micro-organisms!

Application

- Aircraft are thoroughly cleaned and disinfected before the application of ClearCabin.
- ClearCabin is applied to all surfaces by hand to ensure complete coverage by The Leather Institute trained technicians.
- Application becomes a part of the treated surface forming a protective barrier with no toxic residue.
- Reapplication is recommended every 90 days for continuous protection of high touch surfaces.
